

GURU NANAK INSTITUTE OF TECHNOLOGY
An Autonomous Institute under MAKAUT
2022
CONTROL SYSTEM
EC602

TIME ALLOTTED: 3 HOURS

FULL MARKS: 70

The figures in the margin indicate full marks.

Candidates are required to give their answers in their own words as far as practicable

GROUP – A

(Multiple Choice Type Questions)

Answer any **ten** from the following, choosing the correct alternative of each question: **10×1=10**

- | | | Marks | CO No. |
|--------|--|-------|--------|
| 1. (i) | The phase cross over frequency(PCF) at which phase angle is
a) -90 degree
b) 90 degree
c) 180 degree
d) -180 degree | 1 | CO3 |
| (ii) | For type 3 system the initial slope of bode plot will be
a) -40 db/decade
b) +60 db/decade
c) +20 db/decade
d) -60 db/decade | 1 | CO3 |
| (iii) | Derivative error control
a) increases the overshoot
b) decreases the overshoot
c) increases steady state error
d) decreases | 1 | CO5 |
| (iv) | The number of forward path for Fig.1 is | 1 | CO1 |

Fig.1

- | | | | |
|-----|--|---|-----|
| | a) 1
b) 2
c) 3
d) 4 | | |
| (v) | If the gain margin is negative, it indicates the system is
a) stable
b) unstable
c) marginally stable
d) None of these | 1 | CO3 |

- | | | | |
|--------|---|---|-----|
| (vi) | The system with the open loop transfer function $1/s(5+s)$ is: | 1 | CO1 |
| | a) Type 2 and order 1 | | |
| | b) Type 1 and order 1 | | |
| | c) Type 0 and order 0 | | |
| | d) Type 1 and order 2 | | |
| (vii) | The Routh-Hurwitz criterion gives | 1 | CO4 |
| | a) Relative stability | | |
| | b) Absolute stability | | |
| | c) Gain margin | | |
| | d) Phase margin | | |
| (viii) | When the gain K of a system becomes 0, the roots of the loci | 1 | CO3 |
| | a) terminates at the zeros | | |
| | b) move away from the poles | | |
| | c) coincide with the zeros | | |
| | d) coincide with the pole | | |
| (ix) | For $G(s)=(s+1)/s(0.5s+1)$. The corner frequencies are | 1 | CO3 |
| | a) 0.5 and 1 | | |
| | b) 0 and 2 | | |
| | c) 2 and 1 | | |
| | d) None | | |
| (x) | The characteristics equation of a closed loop second order system is given as $s^2 + 4s + 4 = 0$, the damping factor is: | 1 | CO2 |
| | a) 1 | | |
| | b) 2 | | |
| | c) 0.5 | | |
| | d) 4 | | |
| (xi) | In terms of Bode plot, the system is unstable if | 1 | CO3 |
| | a) P.M=G.M | | |
| | b) P.M and G.M both are positive | | |
| | c) P.M and G.M both are negative | | |
| | d) P.M negative but G.M positive | | |
| (xii) | State variable approach converts a n^{th} order system into | 1 | CO5 |
| | a) n first order differential equation | | |
| | b) n second order differential equation | | |
| | c) two differential equation | | |
| | d) a lower order system | | |

GROUP – B

(Short Answer Type Questions)

Answer any **three** from the following: $3 \times 5 = 15$

2.

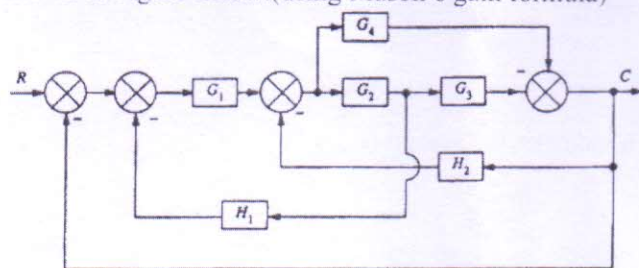

Draw the Signal flow graph and determine C/ R for the block diagram shown in Figure below.(using Mason's gain formula)

Marks

CO No.

5

CO3

3. Define forward path and self-loop. Compute the overall transfer function using Mason's Gain formula. 5 CO2

4. Consider the characteristic equation:
 $S^4 + 15S^3 + 55S^2 + 20S + K = 0$
 Apply R.H criteria and obtain the value of gain k so that the system will be marginally stable. 5 CO4
5. Define the term transfer function and obtain the transfer function of mechanical system as shown below: 5 CO2

6. Derive the expression of error constant (K_p, K_a, K_v) and obtain the value of steady state error for a unity feedback system with $G(s) = 10/(10+s)$ for unit step input. 5 CO1

GROUP - C

(Long Answer Type Questions)

Answer any *three* from the following: $3 \times 15 = 45$

- | | | Marks | CO No. |
|-------|---|-------|--------|
| 7. | The open loop transfer function of a unity feedback system is $G(s) = K/[S(S+1)(S+2)]$. Sketch the root locus and obtain the values of following parameters:
i) Break away point
ii) Angle of asymptotes
iii) Centroid
iv) The value of range K for which system is stable
v) The value of gain K at which the locus crosses the imaginary axis | 15 | CO3 |
| 8 (a) | Write down the drawbacks of transfer function. | 3 | CO1 |
| (b) | A closed loop transfer function of a unity feedback system is $C(s)/R(s) = 1/(S^4 + 10S^3 + 15S^2 + 12S + 10)$. Obtain the state model of the above system. | 7 | CO5 |
| (c) | Define Controllability and check the controllability of the following system: | 5 | CO5 |

$$\begin{bmatrix} \dot{x}_1 \\ \dot{x}_2 \\ \dot{x}_3 \end{bmatrix} = \begin{bmatrix} -2 & 1 & 0 \\ 0 & -3 & 1 \\ -3 & -4 & -5 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} + \begin{bmatrix} 0 \\ 0 \\ 1 \end{bmatrix} u$$

$$Y = [0 \ 1 \ 0] \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix}$$

- | | | | | |
|-----|-----|--|--------|-----|
| 9. | (a) | Define time response and obtain the expression of parabolic response of first order system. | 5 | CO2 |
| | (b) | Draw the unit step response of second order under damped system and define the following terms: Peak time, Peak overshoot, rise time and settling time. | 5 | CO2 |
| | (c) | The open loop transfer function of a unity feedback system is $G(s)=K/s(10+s)$. Determine the gain of K so that the system will have a damping ratio of 0.5.
For this value of K determine settling time (2%), peak time & peak overshoot. | 5 | CO2 |
| 10. | (a) | Draw the bode plot for the transfer function
$G(s)=\frac{50}{s(1+0.25s)(1+0.1s)}$ From the graph determine the following:----- | 5 | CO4 |
| | (b) | Gain Crossover Frequency | 2 | CO4 |
| | (c) | Phase crossover frequency | 2 | CO4 |
| | (d) | Gain margin | 2 | CO4 |
| | (e) | Phase Margin | 2 | CO4 |
| | (f) | Stability of the system | 2 | CO4 |
| 11. | | Write Short notes on any three of the following | 5x3=15 | |
| | (a) | Gain margin and Phase margin | 5 | CO3 |
| | (b) | PID controller | 5 | CO5 |
| | (c) | Mason's gain Formula | 5 | CO1 |
| | (d) | Nyquist Stability Criteria | 5 | CO3 |
| | (e) | Analogous System | 5 | CO1 |
